

Q: Why do we require  $d\bar{x}_a$  to be 1-1 (i.e. rank 2)?

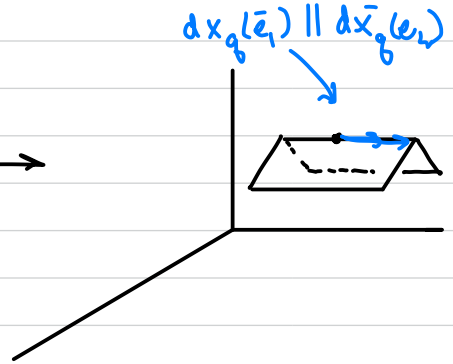

This tells us that there is a well-defined tangent plane  
to  $S$  at  $\bar{p}$ .

If  $d\bar{x}_g \not\equiv 1-1$ , picture would look more like!

e.g.

$\bar{x}, d\bar{x}_g$

or

$\bar{x}, d\bar{x}_g$
