MATH 223: Multivariable Calculus

Class 11: October 4, 2023

Announcements

Exam 1: TONIGHT, 7 PM - No Time Limit

Warner 101

No Books, Computers, Smartphones, etc.

One Page of Notes OK Focus on Chapters 2 and 3

$$\lim_{\mathbf{x}\to\mathbf{a}}\mathbf{f}(x)=\mathbf{b}$$

means

For every ϵ -neighborhood V of \mathbf{b} , there is an δ -neighborhood U of \mathbf{a} such that \mathbf{x} in U ($\mathbf{x} \neq \mathbf{a}$) implies $\mathbf{f}(\mathbf{x})$ is in V.

A function **f** is **continuous** at **a** if there is a **b**, such that

$$\lim_{x\to a} f(x) = b$$

and

$$f(a) = b$$

Today: Begin Chapter 4
Topic: Differentiability
Start with $f: \mathbb{R}^n \to \mathbb{R}^1$ Eventually: $\mathbf{f}: \mathbb{R}^n \to \mathbb{R}^m$

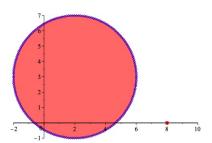

Derivative at point turns out to be $m \times n$ matrix.

But First: Limits and Continuity

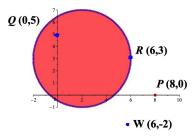

Limits and Continuity: Preliminary Concepts

Open Set Interior Point
Closed Set Boundary Point
Limit Point Neighborhood

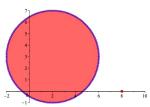

Example:
$$S = \{|x - (2,3)| < 4\} \cup \{(8,0)\}$$

Example: $S = \{|x - (2,3)| < 4\} \cup \{(8,0)\}$

Example:
$$S = \{|x - (2,3)| < 4\} \cup \{(8,0)\}$$

Point	Interior Point?	Limit Point	Boundary Point	
Q	Yes	Yes	Yes	
R	No	Yes	Yes	
Р	No	No	Yes	
W	No	No	No	

$\begin{array}{c} {\sf Differentiability} = {\sf Local\ Linearity} = {\sf Approximatable\ By\ Tangent} \\ {\sf Object} \end{array}$

$$f(x) \approx f(a) + f'(a)(x-a)$$
 or $f(x) - f(a) \approx f'(a)(x-a)$ or $f(x) - f(a) - m(x-a) \approx 0$

$$\lim_{x \to a} \frac{f(x) - f(a) - m(x - a)}{|x - a|} = 0$$

Generalizing for $\mathbf{f}: \mathcal{R}^n \to \mathcal{R}^m$

$$\lim_{x\to a}\frac{f(x)-f(a)-M(x-a)}{|x-a|}=0$$

for some $m \times n$ matrix M.

 $\mathbf{f}: \mathcal{R}^n \to \mathcal{R}^m$ is **differentiable** at \mathbf{a} if there exists an $m \times n$ matrix M such that

$$\lim_{x\to a}\frac{f(x)-f(a)-\textit{M}(x-a)}{|x-a|}=0$$

Special Case: m = 1, n = 2, M is 1×2 matrix $\nabla f = (f_x, f_y)$.

Example:
$$f(x,y) = x^2 + 2xy - y^2$$
 at $(-1,2)$
 $f(-1,2) = -7$
 $f_X(x,y) = 2x + 2y$ so $f_X(-1,2) = 2$
 $f_Y(x,y) = 2x - 2y$ so $f_Y(-1,2) = -6$
 $\nabla f(-1,2) = (2,-6)$
Equation of Tangent Plane:

$$z = -7 + (2, -6) \cdot (x + 1, y - 2)$$

= -7 + 2x + 2 - 6y + 12
= +7 + 2x - 6y

Review meaning of
$$f_x(-1,2) = 2$$
 and $f_y(-1,2) = 6$

What is rate of change of f at (-1,2) if we approach along direction given by $\mathbf{v} = (3,4)$?

$$f_{\mathbf{v}}(-1,2) = \lim_{t \to 0} \frac{f(-1+3t,2+4t) - f(-1,2)}{t}$$

$$= \lim_{t \to 0} \frac{(-1+3t)^2 + 2(-1+3t)(2+4t) - (2+4t)^2 - (-7)}{t}$$

$$= \lim_{t \to 0} \frac{17t^2 - 18t}{t}$$

$$= \lim_{t \to 0} (17t - 18) = -18$$

Note:
$$(\nabla f) \cdot \mathbf{v} = (2, -6) \cdot (3, 4) = (2)(3) + (-6)(4) = 6 - 24 - 18$$

COINCIDENCE?

Major Theorems If f is differentiable at a, then f is continuous at a,

If all partial derivatives of **f** are continuous in a neighborhood of **a**, then **f** is differentiable at **a**.

If **f** is differentiable at **a**,, then *M* is the matrix of first order partial derivatives.

Partial With Respect to a Vector

Let $f(x, y) = x^2y$ and $\mathbf{a} = (3, 9)$ so f(3, 9) = 81.

Find the partial derivative of f at (3,9) if we approach (3,9) along arbitrary vector $\mathbf{v} = (v_1, v_2)$.

We want
$$f_{\mathbf{v}}(\mathbf{a}) = \lim_{t o 0} rac{f(\mathbf{a} + t\mathbf{v}) - f(\mathbf{a})}{t}$$

$$f_{\mathbf{v}}(\mathbf{a}) = \lim_{t \to 0} \frac{f(3 + tv_1, 9 + tv_2) - f(3, 9)}{t}$$
$$= \lim_{t \to 0} \frac{(3 + tv_1)^2 (9 + tv_2) - (3^2)(9)}{t}$$
$$(3^2 + 6tv_1 + t^2v_1^2)(9 + tv_2) - (3^2)(9 + tv_2)$$

$$= \lim_{t \to 0} \frac{(3^2 + 6tv_1 + t^2v_1^2)(9 + tv_2) - (3^2099)}{t}$$

$$= \lim_{t \to 0} \frac{(3^2)(9) + 3^2tv_2 + 6tv_1(9) + 6t^2v_1v_2 + t^2v_1^2(9) + t^3v_1^2v_2 - (3^2v_1^2) + t^2v_1^2(9) + t^2v_1^2(9) + t^2v_1^2(9) + t^2v_1^2v_1^2 - (3^2v_1^2) + t^2v_1^2(9) + t^2v_1^2v_1^2 - (3^2v_1^2) + t^2v_1^2 - (3^2v_$$

$$= \lim_{t \to 0} \frac{t}{t}$$

$$= \lim_{t \to 0} \left(3^2 v_2 + 54 v_1 + t6 v_1 v_2 + t v_1^2(9) + t^2 v_1^2 v_2 \right)$$

$$=9v_2+54v_1=54v_1+9v_2=(54,9)\cdot(v_1,v_2)$$
